**WHAT TO EXPECT WITH CRYOTHERAPY (LIQUID NITROGEN)**

Liquid Nitrogen is extremely cold. It will burn/sting and may be painful during the treatment and for a short time afterwards.

Redness, swelling and the formation of a blister at the site of treatment are common reactions.

Application of Vaseline or a band-aid may be used but is not essential.

Bacterial **infection** and **bleeding** are rare but may occur.

If increased pain or redness occurs 3 days or more after treatment, **please call our office.**

If the treated area(s) have not resolved in 4-6 weeks, follow up **immediately** for additional treatment.
